WP120615 Replacement Request for a PV Valve

10+ Year Old Copeland Power Valve is Finally Replaced

The PVS valve was supplied through Nooter Ericson over 10 years ago and finally began to leak. Power Valves are used for startup and shut down applications. Sometimes, throttling is necessary and two phase flow that would damage other valves does not harm the rugged Copeland Power Valve.

Now that our Power Valve Series has been out over 12 years we are seeing a few of these old timers come back for replacement. But, many are still operating and plants concerned with low maintenance costs instead of always trying the newest item out there are returning for replacements and specifying these valves for new projects.

Compare any Copeland Valve to the competition and you can readily see the difference: strong, rugged valves made to last!
